

# SAFETY & REGULATORY STANDARD

OISD-Standard-105: Maintenance Safety for Rotating Equipment

## 1. Objective and Scope

---

This standard provides minimum mandatory safety protocols for the maintenance, inspection, and overhaul of rotating mechanical equipment in industrial facilities. Compliance ensures the protection of personnel and asset integrity.

## 2. Mandatory Safety Protocols

---

- Energy Isolation and Verification:** A strict lockout-tagout (LOTO) verification step must be completed and documented by the shift supervisor before any maintenance work begins on rotating equipment. All electrical, mechanical, and hydraulic energy sources must be secured.
- Personal Protective Equipment (PPE):** Personnel executing maintenance activities are strictly required to wear specific PPE. At a minimum, this includes safety glasses, industrial-grade gloves, and hearing protection in areas exceeding 85 dBA.
- Process Isolation Procedures:** An approved isolation procedure is required before opening any pressurized component. This includes closing upstream and downstream block valves, opening bleed valves, and ensuring zero process pressure remains in the pump casing or piping segments.

Failure to adhere to these clauses constitutes a severe safety violation and will be subject to internal audit review.
